Electro-Pneumatic Valve Positioners

Models HEP18/19, HEP28/29

OVERVIEW

Mounted on control valves, HEP Electro-Pneumatic Valve Positioners model HEP18/19/28/29 control valve positions swiftly and accurately by supplying or discharging air from pneumatic actuators in response to input signals from controllers.

FEATURES

- Each model uses a pilot valve that features low air consumption and a high capacity. Each single-action model has a stabilizer with three patterns of holes in a pilot base. By rotation switching, it ensures highly sensitive and extremely stable operation with small- to large-capacity actuators.
- The magnet is a high-precision moving coil. With a terminal box, it forms an explosion-proof structure. To check the inside, the covers of these models can be removed during operation.
- The rare-earth metal magnet has excellent magnetic characteristics. The moving coil is round and energized by a flat spring. It requires no leads.
- Since each model is compact and lightweight, it can be used with even a small actuator. No piping is required because the model KZ03 pressure regulator with filter can be directly attached to the positioner.

Figure 1. Input/Output characteristics

Selection of input/output characteristics

Since control valve flow rate characteristics are set by the selection of valve plug characteristics, select linear as the input/output characteristics of the positioner. However, if the valve plug’s flow rate characteristics, which are determined by the valve type and structure, are not what is required, select equal-percentage or quick-opening. Overall flow rate characteristics of control valve can then be adjusted with the positioner.

Table 1. Adjustment of control valve flow rate characteristics using positioner

Valve plug characteristics	I/O characteristics of positioner	Overall flow rate characteristics of control valve
Linear	Quick-opening	Quick-opening
Linear	Equal-percentage	Equal-percentage
Equal-percentage	Quick-opening	Linear
